Solving Equations (Textbook A6 on page A43)

Definition The standard form of a quadratic or second degree equation in one variable is $ax^2+bx+c=0$ where $a,b,c\in\mathbb{R}; a\neq 0$.

Solving quadratic equations

(1) THE FACTORING METHOD – used to solve equations of the form $ax^2+bx+c=0$ that are factorable (see factoring methods on page 2)

Zero-Factor Property: The product of two factors equals zero if and only if one of the factors (or both) is zero.

$$AB=0 \Leftrightarrow A=0 \text{ or } B=0$$

(2) EXTRACTION OF ROOTS – used to solve equations of the form

$x^2=k$ or $(x-p)^2=k$.

$\sqrt{x^2}=\sqrt{k}$ $\sqrt{(x-p)^2}=\sqrt{k}$

$x=\pm\sqrt{k}$ $x-p=\pm\sqrt{k}$

$x=p\pm\sqrt{k}$

(3) QUADRATIC FORMULA If $ax^2+bx+c=0$, then the solutions are given by:

$$x_{1,2}=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$$

Definition The discriminant of a quadratic equation is $\Delta=b^2-4ac$

Properties If $a,b,c\in\mathbb{R}$, then:

If $\Delta>0$, the equation has two distinct real solutions.

If $\Delta=0$, the equation has one real (rational) solution.

If $\Delta<0$, the equation has two complex (nonreal) solutions.

Factoring a polynomial

(for more about factoring, see Factoring Polynomials Handout on www.timetodare.com)

1. GCF Factor out the greatest common factor (if any).

2. Special products

Two terms

$$a^2-b^2=(a-b)(a+b)$$
$$a^3-b^3=(a-b)(a^2+ab+b^2)$$
$$a^3+b^3=(a+b)(a^2-ab+b^2)$$

Three terms

$$a^2+2ab+b^2=(a+b)^2$$
$$a^2-2ab+b^2=(a-b)^2$$

3. Factoring techniques to factor out a trinomial ax^2+bx+c

$a=1$

$x^2+bx+c=(x+\square)(x+\square)$

product = c
sum = b

$a\neq 1$

split the middle term bx

$ax^2+bx+c=ax^2+\square x+\square x+c$

product = ac
sum = b
then factor by grouping

4. If more than four term, factor by grouping.
